

What do you see?

It's a hot summer day and Paul and John Hammock have done a great job designing, maintaining and managing their automatic calf feeding facility. Note the open side walls and the fans. This keeps the calves cool and prevents buildup of respiratory gases and ammonia. Note the drains and dry feed alley. All of these factors help maintain an excellent environment for calves. For more information on Hammock Dairy and to see their posts on calfblog.com access the following URL.
